### gel fraction

Mass fraction of the network material resulting from a network-forming polymerization or crosslinking process.

The gel fraction comprises a single molecule spanning the entire volume of the material sample.

#### Source:

### sol fraction

Mass fraction of the dissolved or dispersed material, resulting from a network-forming polymerization or crosslinking process, that is constituted of molecules of finite (statistically definable) relative molecular masses.

# pre-gel state

State of a network-forming polymerization or crosslinking process in the pre-gel regime.

#### Note:

In the pre-gel state, the sol fraction is equal to unity. All the molecules formed have finite (statistically definable) relative molecular masses.

# pre-gel regime

Stage of a network-forming polymerization or crosslinking process extending up to, but not beyond, the gel point.

#### Note:

The pre-gel regime may be expressed as the length of time or the chemical conversion required to reach the gel point from the start of a polymerization or crosslinking process.

## EXHIBIT E

IUPAC > Gold Book > alphabetical index > G > gel point

PREVIOUS gel permeation chromatography gel time

# gel point

gelation point

Point of incipient network formation in a process forming a chemical or physical polymer network. Notes:

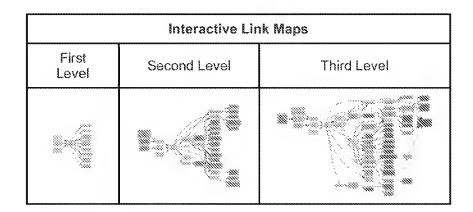

- 1. In both network-forming polymerization and the crosslinking of polymer chains, the gel point is expressed as an extent of chemical reaction (c.f., gel time).
- 2. At the gel point a solid (network) material spanning the entire system is formed.

See also: gel fraction

3. The gel point is often detected using rheological methods. Different methods can give different gel points because viscosity is tending to infinity at the gel point and a unique value cannot be measured directly.
